Subject Index

A

Airports, network of, dynamic ground-holding policies for, 275–291
Algorithms
  decomposition, all-pairs shortest path problem, on massively parallel computer architectures, 292–308
  efficient, shortest covering path problem solution, 317–327
  L-shaped, stochastic location problem, exact solution, 95–103
  polynomial, equal capacity p-center problem, tree networks, 167–175
  solution, transit equilibrium assignment, 193–203
  Weber facility location, presence of forbidden regions and/or travel barriers, 70–76
All-pairs shortest path problem, decomposition algorithm, massively parallel computer architectures, 292–308
Arbitrary mixed gauges, Weber problem, set of optimal points, further results, 141–149
Augmented Lagrangian method, dynamic network traffic assignment models, solution of, in discrete time, 204–220
Axial three-dimensional transportation problem, with heuristic, capacitated carrier transportation problem application, 328–336

B

Block structure, network, multimedian location problem, 116–124

C

Capacitated carrier transportation problem, axial three-dimensional transportation problem, with heuristic, application of, 328–336
Capacities, random arc, restricted recourse strategies, dynamic networks, 3–23
Combined modes, network equilibrium models, 182–192
Computers, massively parallel architectures, decomposition algorithm, all-pairs shortest path problem, 292–308
Congestion pricing, application to, equilibria for networks, lower semicontinuous costs, 221–235
Costs, lower semicontinuous, equilibria for networks with, application to congestion pricing, 221–235

D

Delivery man problem, routing and location routing, on a path, 162–166
Discrete anti-p-center problem, 77–79
Dynamic traffic assignment models, discrete time solutions, augmented Lagrangian method, 204–220

E

Equal capacity p-center problem, tree network, polynomial algorithm, 167
Equilibrium models, network, combined modes, 182–192

F

Facility location, Weber, algorithms for, presence of forbidden regions and/or travel barriers, 70–76
Freight network problem, equilibrium solution, nonlinear tariffs, 236–245

G

Ground-holding policies, dynamic, network of airports, 275–291

H

Handling systems, single-vehicle asynchronous material, analytic model for design and analysis, 337–353

I

Infrastructure facilities, optimal inspection and repair policies for, 55–62

L

Lifetime achievement award, 177–179
Location problem
  stochastic demands, exact solution, 95–103
  traveling repairperson home base, network, 150–161
Location, competing facilities, user-optimizing environment, market externalities, 125–140

M

Market externalities, user-optimizing environment with, location of competing facilities, 125–140
Multi-item joint replenishment problem, transportation and container effects, 37–54
Multimedian location problem, network, block structure exploitation, 116–124

N

Networks
  airports, dynamic ground-holding policies for, 275–291
  block structure exploitation, multimedian location problem, 116–124
  design problem, subgradient methods for, 256–272
  dynamic traffic assignment models, discrete time, augmented Lagrangian method, 204–220
  dynamic, restricted recourse strategies, random arc capacities, 3–23
  equilibria, with lower semicontinuous costs, application to congestion pricing, 221–235
  equilibrium models, combined modes, 182–192
  freight, equilibrium, nonlinear tariffs, 236–245
  optimization model, minimizing trailer-on-flat-car costs, 24–36
  shortest covering path problem, efficient algorithms for solution, 317–327
  structured multifacility location problems, efficient solutions, 104–115
  traveling repairperson home base location problem, 150–161
  tree, equal capacity p-center problem, polynomial algorithm, 167–175
Nonlinear tariffs, freight network equilibrium and, 236–245

O

Optimal inspection and repair policies, infrastructure facilities, 55–62
Optimal points, Weber problem, further results, 141–149

P

Path, routing and location-routing, delivery men problems, 162–166

R

Rail transportation model, with scheduled services, 246–255
Random utilities, optimal locations on a line, 63–69

Routing, location routing and, delivery men problems, path, 162–166

S

Scheduled services, rail transportation model, 246–255
Service network design problem, subgradient methods for, 256–272
Shortest covering path problem, efficient algorithms for solution, 317–327
Single-vehicle asynchronous material, handling systems, analytic model for design and analysis, 337–353
Stochastic demands, location problem with, exact solution, 95–103
Stochastic programming, dynamic networks, restricted recourse strategies, random arc capacities, 3–23
Structured multifacility location problems, efficient solutions, 104–115
Subgradient methods, service network design problem, 256–272

T

Trailer-on-flat-car costs, minimization, network optimization model, 24–36
Trains, rail transportation model, scheduled services, 246–255
Transit equilibrium assignment problem, model, solution algorithms, 193–203
Transit users, equilibrium assignment problem, model, solution algorithms, 193–203
Transportation problems, capacitated carrier problem, an application axial three-dimensional problem, 328–336
Transportation, and container effects, multi-item joint replenishment problem, 37–54
Travel costs, nondeterministic, variance-constrained shortest path problem, 309–316
Traveling repairperson home base location problem, network, 150–161

U

User-optimizing environment, market externalities, location of competing facilities, 125–140

V

Variance-constrained shortest path problem, nondeterministic travel costs, 309–316

W

Weber problem, set of optimal points to, further results, 141–149
